Admin password * ⓘ	<input type="password" value="....."/>
Confirm password *	<input type="password" value="....."/>
Enable multisite ⓘ	<input type="checkbox"/>

Azure Content Delivery Network (CDN) is a service provided by Microsoft Azure to deliver high-bandwidth content to users. It stores cached versions of content in multiple geographical locations for faster delivery to users.

Azure CDN uses edge servers located in various parts of the world to store and distribute content closer to the users, reducing latency and increasing the speed of your web applications. It is designed to handle heavy traffic loads, manage sudden traffic spikes, and securely deliver content.

Azure Front Door is a scalable and secure entry point for fast delivery of your global web applications. In other words, it's a networking service offered by Microsoft Azure that allows for the handling of web traffic in an optimized and secure manner.

Azure Front Door optimizes application performance by load balancing traffic across multiple locations or services, while also providing web application firewall (WAF) protection and threat intelligence to identify and mitigate potential security risks.

Virtual Network

Virtual networks are logically isolated from each other in Azure. You can configure their IP address ranges, subnets, route tables, gateways, and security settings, much like a traditional network in your data center. Virtual machines in the same virtual network can access each other by default. [Learn More](#) ⓘ

Virtual Network ⓘ

(New) wordpress9-f04af7c87d-vnet

Azure Blob Storage, offered by Microsoft Azure, is a service for storing large amounts of unstructured, semi-structured, or structured data, including text or binary data. "Blob" stands for Binary Large Object.

It can handle data such as documents, images, videos, backups, log files, or application data. This service is designed to be highly scalable, reliable, and secure.

Create WordPress on App Service ...

Basics Advanced Tags Review + create

Tags are name/value pairs that enable you to categorize resources and view consolidated billing by applying the same tag to multiple resources and resource groups.

Note that if you create tags and then change resource settings on other tabs, your tags will be automatically updated.

Name ⓘ	Value ⓘ	Resource
<input type="text" value="key"/>	<input type="text" value="wordpress"/>	4 selected ▾ 
<input type="text" value="key"/>	<input type="text"/>	4 selected ▾

In Microsoft Azure, tags are used to logically organize and categorize resources based on the user's needs. A tag is simply a name-value pair, where the name is the tag and the value is information related to the tag.

For example, you might want to label resources according to who owns them, what projects they're associated with, or which department they belong to. You can create a tag with the name "Owner" and the value might be the specific person's name. Another tag might have the name "Project" and the value might be the specific project's name.

Azure makes it easy to deleted resources.

Rather than delete each resource individually, by deleting the entire resource group NAME, all resources are effectively deleted simultaneously.

Delete a resource group

The following resource group and all its dependent resources will be permanently deleted.

Resource group to be deleted
